#### Abstract

Data are presented from a number of different sites in which oral reading fluency was measured using the procedures commonly ascribed to curriculum-based measurement (CBM). This measurement system focuses on automaticity in reading and therefore students are directed to read aloud from grade level passages for one minute, with words read correctly counted. Data are presented across various sites, compiling the outcomes across various passages and depicting the results in both average performance and percentile bands for fall, winter, and spring across grades 1-8. These data are referred to as normative because of the large sample and robust passage sampling.

## Introduction

"In every branch of instruction in the public schools we need a definite standard of attainment to be reached at the end of each grade. If we had such standards and if we had adequate means of precisely measuring efficiency, it would be possible for a qualified person to go into a schoolroom and measure the attainment in any or all subjects and determine on the basis of his measurements whether the pupils are up to the standard, whether they are deficient, and in what specific respect" (p. 14, Starch, 1915).

Although this quote sounds like something applicable to the standards of 2004, it actually occurred almost 90 years ago. Not only did he propose standards but actually attained them as "universal standards that would be obtained from tests in many schools in various cities" (p. 15). In table 1, the results have been displayed in his original metric (words per second) as well as the more current manner of reporting (words per minute). These data were obtained from " 3,511 pupils in 15 schools in seven cities located in three states (Wisconsin, Minnesota, and New York)" (p. 14).

Table 1
Norms Reported by Starch in 1915

| Grade: | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{8}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Words/Second | 1.5 | 1.8 | 2.1 | 2.4 | 2.8 | 3.2 | 3.6 | 4.0 |
| Words/Minute | 90 | 108 | 126 | 144 | 168 | 192 | 216 | 240 |

The question is how do they compare with the norms published by Hasbrouck and Tindal in 1992. In table 2, we display the results from that effort, reflecting the $50^{\text {th }}$ percentile rank from several thousand students in several districts at each grade tested in the spring. Clearly, the reading proficiency of students has deteriorated (assuming comparable populations).

Table 2
Norms Reported by Hasbrouck and Tindal in 1992

| Grade: | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ |
| :--- | :---: | :---: | :---: | :---: |
| Words/Minute | 94 | 114 | 118 | 128 |

To ascertain the stability of these performance levels, we recently collected data from thousands of students across the country. In table 3, we have displayed the comparable results of reading fluency in grades 1 to 8 in the spring.

Table 3
Norms Reported by Hasbrouck and Tindal in 2005

| Grade: | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{8}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Words/Minute | 59 | 89 | 107 | 125 | 138 | 150 | 150 | 150 |

While performance modulates slightly across the grades, the average reading performance has remained remarkably stable for the past 15 years. Following are the percentile breakdowns for all grades by season (fall, winter, and spring).
